

I propose to write an iPhone application that implements a movie watch list with a ranking capability. The program will include the following features:

- Accepts Movie Name from User
- Implements the following views:
  - List of movies to watch
  - List of movies ranked
  - Mark movie as watched or cancel
- Supports deleting an entry in the "Watch List" with a swipe
- Supports adding new entries to the Watch List by entering the name of a movie and pressing a button to add
- Program stores data in a database on preemption
- My research will be being able to gather the Ranked List and enable to share the list with the sharing features by Text message
